(54) Title: METHOD AND APPARATUS FOR POWER MANAGEMENT IN MOBILE TERMINALS

(57) Abstract: A power saving management device includes a controller, a sensor in communication with the controller for providing status of whether or not the sensor is active. A power circuitry module is in communication with the controller and with at least one of a predetermined non-essential circuitry and a display. The controller signals the power circuitry module to power on at least one of a predetermined non-essential circuitry and the display when an amount sensed by the sensor reaches a first predetermined threshold amount. The predetermined non-essential circuitry can include one or more of: non-essential storage or mediums that require either constant power or at least a periodic refreshing, including a diskette drive and a controller, a cd/dvd or other types of drives and respective controllers, expanded storage, cache storage, predetermined communication circuitry, output ports, a transmitter, and. sound circuitry.
